Section: BSIT 3A

For me I believe assessment is not the end of learning but part of it. Its main purpose is to show learners where they are, where they need to go, and how to get there. A score alone cannot do that. Assessment should therefore help learners improve by giving them clear information they can act on, not just a grade to accept.

For assessment to help learners improve, it must come with timely, specific feedback. Comments such as "good job" or “needs work” teach very little, while feedback like “your logic is sound, but your loop does not handle an empty list” tells a learner exactly what to fix. I would use formative assessments such as short quizzes, exit tickets, practice tasks, and draft submissions, and give learners the chance to revise their work. Mistakes become the starting point for learning instead of the final verdict.

I believe fair, valid, and transparent assessment rests on three commitments. It is fair when every learner has an equal chance to show what they know, which means considering different learning needs, offering varied formats where appropriate, and avoiding trick questions. It is valid when it measures what was actually taught: if I teach problem-solving, I should not grade memorization. It is transparent when learners know the expectations before they begin.
