Classroom Management Plan

Subject area: Computer Programming

Year level: 1st year college, about 35 learners per class, ages 18 to 20, 60 minute sessions held in a classroom with a computer lab used once a week.

Learner profile:

> Age and interests: Early adolescents who are active on social media, games, and short videos. They respond well to projects that connect to what they already use apps, games, websites.
>
> Learning abilities: A mixed-ability class. A few learners already code on their own, many are beginners, and some read and follow written instructions slowly.
>
> Classroom behavior: Energetic and talkative, easily pulled toward phones and unrelated browser tabs, and some are shy about asking for help in front of peers.
>
> Possible challenges: Uneven access to devices and internet at home, low confidence after early errors in coding, group work in which one member does everything, and difficulty restarting after a break.

Guiding belief: Most misbehavior is a signal that a need is unmet like clarity, confidence, belonging, or attention. My plan therefore prevents problems first, teaches expectations explicitly, and responds to behavior by looking at its cause before choosing a consequence.

1. Rules and Expectations

I will co create these with my learners during the first week so they feel that they belong. I will keep the list short, phrase each as what to do, and tie each to a reason.

Rule	What it looks like	Why it matters
Be ready to learn.	Arrive on time, bring your notebook, log in or open your materials within 3 minutes.	Our time together is short, and every
Use technology	Keep screens on the task, and keep phones face-down in the phone parking area unless the activity needs them.	Focus makes coding easier and faster.
Speak with respect.	Use kind words, listen when others talk, and disagree with ideas, not people.	Everyone should feel safe to try and make
Ask and offer help.	Try first, check your notes, ask a seatmate, then raise your hand or use the help card. Help others by	Debugging together is how real
Care for our space and	Log out, push in chairs, and report problems with devices right away.	Shared tools stay usable for everyone.

Making the rules clear, fair, and teachable

Teach them like content. On Day 1 I model and practice each rule with examples and non examples (for example, a role-play of asking for help properly versus calling out. I will revisit the rules after long breaks and before lab days.
Fair for everyone. The rules apply equally to all learners and to me. I will use the same reminders and the same steps for every student, and I will adjust supports, not standards, for learners with special needs.
Visible and simple. Rules are posted on the wall and on the first slide of every lesson, with icons for learners who read slowly.

Positive reinforcement. I will give specific praise ("Thank you for helping Ana trace her loop without typing for her"), a weekly "Bug Buster" shout-out for helpful behavior, and team points that lead to a class reward such as choosing the warm-up game.
Student voice. At mid-term I will run a quick check-in (what is working, what should change) so the rules stay relevant.

2. Time Management

Daily routine for a 60 minute class

Minutes	Segment	What happens	Routine signal
0 to 5	**Entry task**	A short question or mini-challenge is on the board (for example, predict the output of 3 lines of code). Learners start silently while I take attendance.	Slide titled "Start Now"
5 to 10	**Review and objective**	Quick recall of the last lesson, then I state today's learning target and success criteria.	Chime or countdown
10 to 25	**Mini-lesson**	Direct instruction with live coding, with a check for understanding every 5 minutes (thumbs up, mini whiteboards, or a one-question poll).	"Eyes up" hand signal
25 to 50	**Guided and independent practice**	Pairs or small groups work on tiered tasks (core, extended, challenge). I circulate, conference, and pull a small group for reteaching.	Help card: green = fine, yellow = question, red = stuck
50 to 57	**Closure**	Exit ticket: one thing learned, one question remaining.	Timer on screen
57 to 60	**Reset and dismissal**	Log out, tidy up, and dismiss by row.	"Reset" song or 3-minute timer

Transitions

Predictable cues. I will use the same signals every day (a chime, a raised hand, and a countdown timer on screen) so that learners know what to do without extra instruction.

Teach and rehearse transitions. Early in the term I will practice moving from lecture to pairs and to lab, with a target of under 90 seconds, and let the class beat its own record.

Prepared materials. Handouts, starter files, and links are posted in advance on our class page or already open on the lab computers, so no time is lost waiting for materials.

Clear directions in three parts. I give directions in three steps (what, how long, what to do when finished), post them on screen, and ask a learner to repeat them back. Protecting time-on-task

Bell-to-bell teaching. Learning starts with the entry task, and there is no dead time at the beginning or end.

Early finisher menu. Extension challenges, peer tutoring, or an open-ended mini-project so fast learners stay engaged instead of drifting off-task.
Tiered tasks and scaffolds. Sentence starters, code templates, and worked examples keep beginners from giving up, while challenge tasks keep advanced learners moving.
Managing technology. Phones go in a phone parking pocket. On lab days I use screen-visible seating, monitoring software or frequent circulation, and a "lids half-down" signal when I need attention.
Procedures for common interruptions. Pencil and charger requests, restroom passes, and late arrivals follow set routines that do not require stopping the lesson. Proximity and circulation. I will move around the room so that no group goes more than a few minutes without a check-in.

3. Discipline Matrix

My approach is preventive first, restorative second, and corrective last. For each likely concern I look for the root cause before choosing an action, and I record repeated patterns to see what needs to change in my teaching.

Likely behavior concern	Possible root causes	Action steps
Off-task phone or browser use	Boredom or task is too easy or too hard; habit; social pressure; learner finished early	1) Non-verbal cue and proximity. 2) Quiet reminder of the expected action and offer of the next task. 3) Phone placed in the parking pocket until end of class. 4) Private conference to find out what is making the task hard to stay on. 5) Contact the parent or guardian if it recurs.
Talking out of turn or side conversations	Need for belonging and attention; unclear directions; energy needs a release	1) Pause and wait using the attention signal. 2) Give the learner a role (for example, group reporter). 3) Seat change with a calm explanation. 4) Private talk about how to share ideas at the right time. 5) Positive reinforcement when the change is shown.
Not starting work or giving up quickly	Fear of mistakes, low confidence, gaps in prior knowledge, unclear instructions	1) Check understanding and restate the task in smaller steps. 2) Provide a template or worked example. 3) Pair with a supportive peer. 4) Celebrate small wins and normalize errors. 5) Refer to remedial support if gaps persist.

Free-riding in group work	Unclear roles, one dominant member, low confidence, learner does not feel responsible	1) Assign rotating roles (driver, navigator, tester, reporter). 2) Each member submits a short individual contribution. 3) Brief group conference on fair sharing. 4) Adjust grouping.
Disrespectful remarks or teasing	Seeking attention or status, peer conflict, personal stress, or lack of empathy skills	1) Address it privately and calmly right away. 2) Restate the respect rule and its impact on others. 3) Restorative conversation or apology in action (for example, helping the classmate). 4) Behavior reflection form. 5) Involve the guidance counselor and parents for repeated or serious cases.
Tardiness or frequent absences	Transportation, family responsibilities, work, health, or loss of interest	1) Welcome the learner back without shaming. 2) Provide a catch-up plan and materials. 3) Ask what support is needed. 4) Coordinate with the adviser, guidance office, and family.
Defiance or refusal to follow directions	Feeling embarrassed, power struggle, stress, or unmet needs outside school	1) Stay calm, give a private choice ("You can start with the first task or work in the quiet corner"). 2) Give cool-down time. 3) Follow-up conversation to find out the cause. 4) Written behavior agreement. 5) Referral to the guidance counselor and parent conference.

Escalation ladder

Prevent: clear expectations, engaging tasks, and strong relationships.
Redirect: non-verbal cue, proximity, or a quiet reminder.
Private talk: one-to-one conversation about the cause and agreement on next steps.
Logical consequence: a consequence connected to the behavior (for example, loss of device privileges for misuse, repairing harm done).
Partnership: call or meeting with the parent or guardian, with guidance counselor involvement and a written support plan.
Referral: school administration for serious or repeated concerns, following the school's student handbook and child protection policy.

Principles I will follow: no public shaming, no punishment that harms dignity, consistent and fair application, documentation of repeated incidents, and always a path back to a fresh start. A classroom runs well when learners know what is expected, feel that their time is used well, and trust that I will respond to them fairly. By teaching expectations explicitly, designing routines that keep learners busy with meaningful tasks, and using a discipline approach that looks for causes first, I aim to create a classroom where every Grade 9 learner can focus, take risks with coding, and grow in responsibility.
