Part 1: Concept Check

Content selection criteria are the standards used to decide what belongs in a lesson. The common ones are:

Validity: content actually aligns with the stated objectives.

Significance: it contributes something meaningful/transferable, not trivia.

Learnability: it’s appropriate to students' developmental level and prior knowledge.

Feasibility: it can realistically be taught in the time/resources available.

Interest: it’s relevant to learners' needs or future use.

Simple to complex: basics before advanced application.

Prerequisite learning: skill A must come before skill B if B depends on A.

Chronological: order of events in time.
Known to unknown: build on what students already know.

A sequence is flawed when it violates prerequisite learning asks students to do something before they've learned how or when assessment/application happens before instruction.

Part 2: Application

Problems in the outline;

1. Monday: Had a wrong sequence since it violates prerequisite learning students are asked to rewrite and defend a curriculum outline on Day 1, before they've been taught what content selection criteria or sequencing patterns even are. This is the most advanced task in the whole week, and its placed first. It's like asking students to edit an essay before teaching them grammar.

2. Wednesday: Had the wrong sequence because they did an advanced task too early an advanced critique activity involving a multi subject curriculum is scheduled on Day 3, right after only one day Tuesday of introductory content. Critique of a complex case is a higher-order skill that should come after students have practiced on simpler examples not right after the first exposure to the concept.

3. Thursday: misplaced assessment
A 10 item quiz on content selection criteria is given on Thursday, but content selection criteria isn't actually taught until Friday's lecture. Students are tested on material before it's presented this violates basic instructional logic assessment should follow instruction, not precede it.

4. Friday: A foundational content placed last
The lecture on basic concepts of content selection is the most foundational, introductory content in the whole unit, yet it's taught last. Foundational content should anchor the sequence at the start, since sequencing Tuesday and critique Wednesday both depend on understanding selection criteria first.

5. Overall outcome misalignment
Because of the ordering, several outcomes are unreachable when scheduled Monday's outcome justify their revised outline requires knowledge students don't have yet; Thursday's outcome recall important concepts tests unlearned concepts.

Revised Outline

Day	Topic	Intended Outcome
Monday	Lecture: basic concepts of content selection and discussion of what makes content appropriate for learners	Students will identify content selection criteria
Tuesday	Introduction to content sequencing and discussion of prerequisite skills	Students will identify different sequencing methods
Wednesday	Introduction to content sequencing and discussion of prerequisite skills	Students will apply selection/ sequencing criteria to a basic case
Thursday	Advanced critique activity: analyze a complex, multi-subject curriculum and identify all sequencing problems	Students will analyze curriculum problems
Friday	Students rewrite a flawed 1-week outline and defend their revisions and a quiz on concepts	Students will justify their revised outline and demonstrate recall of key concepts

Justification for each change

Moved the "basic concepts" lecture to Monday from Friday Content selection criteria is the prerequisite foundation for everything else in the unit sequencing, critique, and revision all require students to already know what makes content appropriate. Per the prerequisite learning pattern, foundational knowledge must be taught first.

Kept Tuesday's sequencing intro in place This logically follows content selection Monday, since what to teach naturally precedes in what order to teach it. This is valid simple to complex progression.

Added a new Wednesday activity simple critique instead of jumping straight to advanced Skipping from one day of theory directly to a multi subject complex critique is too large a jump. Inserting a simple case practice day respects the

simple to complex principle and gives students a scaffolded step between concept and complex application.

Moved the advanced critique originally Wednesday to Thursday Now that students have practiced on a simple case, they're prepared for the harder, multi subject critique this is the appropriate point in the sequence for a higher-order analytical task.

Moved the rewrite and-defend task originally Monday to Friday, and merged the quiz into it as a review/close: This is the most demanding, synthesis level task in the unit it requires students to apply everything selection criteria and sequencing patterns and justify their choices. It belongs at the end, functioning as a capstone or a summative task, not as an opener. The quiz now serves as a check for recall of concepts students have actually already learned, rather than testing unlearned material.

General principle applied throughout Instruction, guided practice, independent complex application, assessment. The original outline had this order almost entirely inverted synthesis first, foundational content last, assessment sandwiched in the wrong place. The revision restores a coherent simple to complex, prerequisite respecting flow so that every day's outcome is actually achievable given what students know by that point.
