My take on homework:

For me I do not think homework should be all or nothing. Homework often works best for students who have quite and learner conducive environments or homes. And it can make homework very tedious. A strict no homework policy also has its cons because some skills might only stick or flourish if constant practice is being done for example like programming you wont get better by reading forums or digital material you learn by doing it. So Im in between less homework, but better homework.

If Im to be given and assignment it needs to correlate with the lesson being taught to us because what good is homework if the homework given does not correlate with the lessons being taught by the teacher. Or if its a project id make sure it is feasible and doable by my students in terms of time, resources and man power. Because if Im just gonna cram my students with homework or projects that do not benefit them then I have failed to educate them as an educator. Learning should be challenging but not torture. Learning is best when learners are positive and motivated.

3 Question Techniques:

- Give ample wait time. If I ask a question I shall wait at least 5 to 10 seconds before calling anyone so I can give my students time to think or focus on the questions.
- Always give a follow up question. This allows assurance the learner has learned something. This also gives them to opportunity to show what they've learned and how much of it they understand
- Asking open ended questions. Instead of only asking recall questions, I'll ask things like "Why might this approach fail?" or "How could you improve this?" Students think on their own first, then talk with a partner, then share with the class.
